CSCI-1200 Data Structures — Fall 2014 Lecture 11 — Linked Lists, Part II

Review from Lecture 10

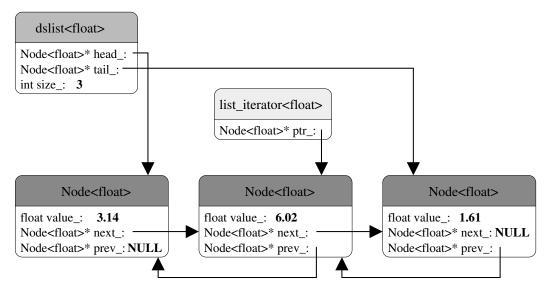

- Limitations of singly-linked lists
- Doubly-linked lists: Structure, Insert, & Remove

Today's Lecture

- Our own version of the STL list<T> class, named dslist
- Implementing list iterators

11.1 The dslist Class — Overview

- We will write a templated class called dslist that implements much of the functionality of the std::list<T> container and uses a doubly-linked list as its internal, low-level data structure.
- Three classes are involved: the node class, the iterator class, and the dslist class itself.
- Below is a basic diagram showing how these three classes are related to each other:

• For each list object created by a program, we have one instance of the dslist class, and multiple instances of the Node. For each iterator variable (of type dslist<T>::iterator) that is used in the program, we create an instance of the list_iterator class.

11.2 The Node Class

- It is ok to make all members public because individual nodes are never seen outside the list class.
- Note that the constructors initialize the pointers to NULL.

```
template <class T> class Node {
public:
   Node() : next_(NULL), prev_(NULL) {}
   Node( const T& v ) : value_(v), next_(NULL), prev_(NULL) {}
   T value_;
   Node<T>* next_;
   Node<T>* prev_;
};
```

11.3 The Iterator Class — Desired Functionality

- Increment and decrement operators (will be operations on pointers).
- Dereferencing to access contents of a node in a list.
- Two comparison operations: operator == and operator! =.

11.4 The Iterator Class — Implementation

- Separate class
- Stores a pointer to a node in a linked list
- Constructors initialize the pointer they will be called from the dslist<T> class member functions.
 - dslist<T> is a friend class to allow access to the pointer for dslist<T> member functions such as erase and insert.
- operator* dereferences the pointer and gives access to the contents of a node.
- Stepping through the chain of the linked-list is implemented by the increment and decrement operators.
- operator== and operator!= are defined, but no other comparison operators are allowed.

11.5 The dslist Class — Overview

- Manages the actions of the iterator and node classes
- Maintains the head and tail pointers and the size of the list
- Manages the overall structure of the class through member functions
- Three member variables: head_, tail_, size_
- Typedef for the iterator name
- Prototypes for member functions, which are equivalent to the std::list<T> member functions
- Some things are missing, most notably const_iterator and reverse_iterator.

11.6 The dslist class — Implementation Details

- Many short functions are in-lined
- Clearly, it must contain the "big 3": copy constructor, operator=, and destructor. The details of these are realized through the private copy_list and destroy_list member functions.

11.7 C++ Template Implementation Detail - Using typename

- The use of typedefs within a templated class, for example the dslist<T>::iterator can confuse the compiler because it is a template-parameter dependent name and is thus ambiguous in some contexts. (Is it a value or is it a type?)
- If you get a strange error during compilation (where the compiler is clearly confused about seemingly clear and logical code), you will need to explicitly let the compiler know that it is a type by putting the typename keyword in front of the type. For example, inside of the operator== function:

```
typename dslist<T>::iterator lft_itr = lft.begin();
```

• Don't worry, we'll never test you on where this keyword is needed. Just be prepared to use it when working on the homework.

11.8 Exercises

- 1. Write dslist<T>::push_front
- 2. Write dslist<T>::erase

10/03/14

02:42:10

```
friend class dslist<T>;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   void pop_back();
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                //REPRESENTATION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  template <class T>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Node<T>* head_;
Node<T>* tail_;
                                                                                                                                                                                                                                                                                                                                                                    Node<T>* ptr_;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  class dslist {
                                                            // A simplified implementation of a generic list container class, 
// including the iterator, but not the const_iterators. Three 
// separate classes are defined: a Node class, an iterator class, and 
// the actual list class. The underlying list is doubly-linked, but
